

table management

Tables and Guests

Tracked, mapped and managed.

Automation for the Hostess Station

Point of Success Table and Guest Management handles wait lists, guest reservations, table status and gives extensive statistical information for manager and hostess staff.

Table Map

Define your dining area on one screen or assign different rooms or dining areas to separate tabs. Table sizes, shapes and seating capacities are controlled in the table map designer.

- Check table status
- Open or close a station or dining area
- Visually tie tables to servers and dining areas
- Select a table from the table map in Point of Success Order Entry to create or edit a guest order

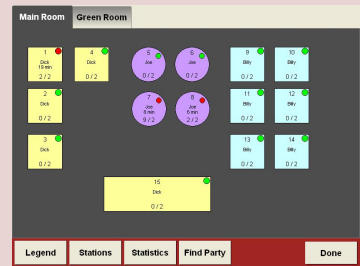

Wait List and Reservations

No more paper lists for waiting or reservation guests!

- Enter guest name, party size, and seating preference
- Record estimated wait time
- Track waiting guest statistics (total guests waiting, longest wait time, average wait time)
- Take reservations for any date in the future
- Set your reservation list time interval and the total number of reservations permitted for any time slot

Manager's Console

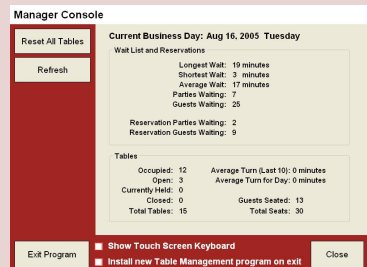

The Manager's Console gives a one-screen overview of guest seating, wait list and reservation performance. Separate statistics windows are available for the hospitality staff to check statistics for the wait list and dining room without accessing the Manager's Console.

Create a map of the entire restaurant on one page or break out different rooms or dining areas to separate tabs in the table map. Use the table map in Point of Success Order Entry to create a new order or edit an existing guest check.

Manage a wait list and guest reservations from one window. Designed for use with a touch screen and also works with a standard display, keyboard and mouse.

The Manager's Console gives a statistical overview of wait list, reservation and table turn performance.
